

South River Water Department (PWSID#: NJ1223001)

9 Ivan Way, South River, NJ 08882

Year 2022 Annual Water Quality Report

What's The Quality of Your Water?

South River Water Department is proud to supply you with this year's Water Quality Report required by the State of New Jersey Department of Environmental Protection (NJDEP) and the U.S. Environmental Protection Agency (EPA). The tables in this report show the results of our water quality analysis in the year 2022. Every regulated contaminant detected in the water, even in the minutest traces, is listed. The table contains the name of each highest level allowed by regulation (MCL), the ideal goals for public health (MCLG), usual sources of such contamination, definitions that explain what was tested, and a key to the units of measurement. *The data tables in this report show only the substances **detected** in your water; other substances may have been tested and not detected.*

The EPA requires monitoring for over 80 drinking water contaminants. The contaminants listed in the table on the next page reflect only the contaminants detected in your water for the monitoring period January 1 to December 31, 2022. We routinely monitor for contaminants in your drinking water according to federal and state laws. The state allows us to monitor for some contaminants less than once per year because the concentrations of those contaminants do not change frequently. Some of our data, though representative, may be more than one year old.

Sources of Supply

The Borough of South River utilizes groundwater from three wells located near the water treatment plant. The treatment plant utilizes chlorine as a pre-oxidant prior to greensand filters for the removal of iron and manganese. Lime is utilized for pH adjustment to reduce the corrosiveness of the water supply. A second dosage of chlorine is utilized to maintain disinfection in the distribution system. The Borough of South River also utilizes surface water source treated by Middlesex Water through an agreement with The Township of East Brunswick.

Water System Information

South River Water Department values our customers and works hard to ensure their satisfaction. We welcome you to attend a monthly meeting held every 2nd & 4th Monday of each month at 7:00 pm at 61 Main St, South River NJ. Specific meeting dates can be found by visiting the town website at www.southernrivernj.org. You may also contact us with any questions at (732)257-1999.

Landlords

Landlords must distribute this information to every tenant as soon as practical, but no later than three Business days after receipt. Delivery must be done by hand, mail or email, and by posting the information in a prominent location at the entrance of each rental premises, pursuant to section 3 of P.L. 2021, c. 82 (C.58:12A-12.4 et seq).

GENERAL DRINKING WATER INFORMATION:

Water Sources

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

- *Biological* - may come from human, agricultural, or wildlife sources.
- *Inorganic* - can be natural, from storm run-off, or from industrial or domestic wastewater discharges.
- *Pesticides and herbicides* - may come from agricultural, storm run-off or residential use.
- *Organic chemicals* - may come from industrial or domestic processes, storm run-off, and septic systems.
- *Radioactive materials* - can be naturally occurring or the result of mining or other human activities.

Presence of Contaminants

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (1-800-426-4791).

Immuno-Compromised Persons

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

SOUTH RIVER WATER DEPARTMENT WATER QUALITY TABLE

Contaminant	MCL Violation Y/N	Level Detected South River Water Department NJ1223001	Level Detected East Brunswick Water Utility NJ1204001	Unit of Measure	MCL (Highest Level Allowed)	MCLG (Goal)	Potential Source
Total Coliform Results Year: 2022	N	0 positive (+) 191 samples	2 positive (+) 628 samples	Absent or Present	0	0	Leaking septic system, runoff from streams
Lead Results Year: South River: 1/1/22– 6/30/22 East Brunswick: 1/1/22– 12/31/22	N	90 th percentile: 5.5 ppb Low: <1 ppb High: 33 ppb 1 sample exceeded the Action Limit	90 th percentile: 0.28 ppb Low: <0.9 ppb High: 10.5 ppb 0 samples exceeded the Action Limit	ppb	15 (Action Limit)	0	Corrosion of household plumbing systems, erosion of natural deposits
Lead Results Year: South River: 7/1/22– 12/31/22	N	90 th percentile: 4 ppb Low: <1 ppb High: 50.4 ppb 1 sample exceeded the Action Limit	N/A	ppb	15 (Action Limit)	0	Corrosion of household plumbing systems, erosion of natural deposits
Copper South River: 1/1/22– 6/30/22 East Brunswick: 1/1/22– 12/31/22	Y	90 th percentile: 1.83 ppm Low: <0.04 ppm High: 2.31 ppm 13 samples exceeded the Action Limit	90 th percentile: 0.246 ppm Low: <0.0226 ppm High: 0.31 ppm 0 samples exceeded the Action Limit	ppm	1.3 (Action Limit)	1.3	Corrosion of household plumbing
Copper Results Year: South River: 7/1/22– 12/31/22	N	90 th percentile: 0.96 ppm Low: <0.04 ppm High: 1.99 ppm 3 samples exceeded the Action Limit	N/A	ppm	1.3 (Action Limit)	1.3	Corrosion of household plumbing
THM Stage 2 Results Year: 2022	N	Range: 5-63 Highest LRAA: 37	Range: 0.95- 108 Highest LRAA: 68	ppb	80	N/A	Disinfectant Byproducts
HAAS Stage 2 Results Year: 2022	N	Range: ND-34 Highest LRAA: 21	Range: ND-36 Highest LRAA: 42	ppb	60	N/A	Disinfectant Byproducts
Chlorine Residual Results Year: 2022	N	Range: 0.01-1.9 Average: 0.55	Range: 0.05-2.0 Average: 1.01	ppm	4	4	Water additive used to control microbes
Barium Results Year: 2020	N	0.05 1 sample	N/A	ppm	2	2	Discharge of drilling wastes; discharge from metal refineries; erosion of natural deposits
Chromium Results Year: 2020	N	0.75 1 sample	N/A	ppb	100	100	Discharge from steel and pulp mills; erosion of natural deposits
Nickel Results Year: 2020	N	3.3 1 sample	N/A	ppb	100	100	Erosion of natural deposits; found in Earth's crust
PFOA Results Year: 2022	N	ND 4 Samples	2.2 1 Sample	ppt	14	N/A	Discharge from industrial, chemical, and manufacturing factories, release of aqueous film forming foam
PFOS Results Year: 2022	N	ND 4 Samples	2.3 1 Sample	ppt	13	N/A	Discharge from industrial, chemical factories, release of aqueous film forming foam

Special note regarding Lead: Call us at (732) 257-1999 to find out how to get our water tested for lead. Testing is essential because you cannot see, taste, or smell lead in drinking water.

Radiologicals

Contaminant	MCL Violation Y/N	Level Detected South River Water Department NJ1223001	Level Detected East Brunswick Water Utility NJ1204001	Unit of Measure	MCL (Highest Level Allowed)	MCLG (Goal)	Potential Source
Gross Alpha Results Year: 2021	N	3.37 1 Sample	N/A	pCi/L	15	0	Erosion of natural deposits

Secondary Contaminants

Contaminant	Level Detected South River Water Department NJ1223001	Level Detected East Brunswick Water Utility NJ1204001	Unit of Measure	RUL	Potential Source
Aluminum Results Year: 2020	0.01 1 sample	N/A	ppm	0.2	Naturally Occurring
Chloride Results Year: 2020	53 1 sample	N/A	ppm	250	Naturally Occurring
Hardness Results Year: 2020	136 1 sample	N/A	ppm	250	Naturally Occurring
Sodium Results Year: 2020	25 1 sample	N/A	ppm	50	Naturally Occurring
Sulfate Results Year: 2020	34 1 sample	N/A	ppm	250	Naturally Occurring
Total Dissolved Solids Results Year: 2020	305 1 sample	N/A	ppm	500	Naturally Occurring
Manganese Results Year: 2020	0.006 1 sample	N/A	ppm	0.05	Naturally Occurring
Zinc Results Year: 2020	0.01 1 sample	N/A	ppm	5	Naturally Occurring

How to read this report:

Word, Acronym, Symbol or Note	Definition
Y/N	Yes/No
AL	Action Level. The concentration of a contaminant, which, if exceeded, triggers a treatment or other requirements, which a water system must follow.
CDC	Centers for Disease Control
EPA	United States Environmental Protection Agency.
LRAA	Locational Running Annual Average
MCL	Maximum Contaminant Level. The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.
MCLG	Maximum Contaminant Level Goal. The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.
MRDL	Maximum Residual Disinfectant Level – The highest level of a disinfectant allowed in drinking water.
MRDLG	Maximum Residual Disinfectant Level Goal – The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.
N/A	Not applicable
NJDEP	New Jersey Department of Environmental Protection
ND	Not detected

ppb	Parts per billion. Means 1 part per 1,000,000,000 (same as micrograms per liter) and correspond to 1 penny in \$10 million.
ppm	Parts per million. Means 1 part per 1,000,000 parts (same as milligrams per liter) and corresponds to 1 penny in \$10,000.
ppt	Parts per trillion. Means 1 part per 1000,000,000,000 parts (same as nanograms per liter) and corresponds to 1 penny in \$10 billion.
RAA	Running Annual Average
RUL	Recommended Upper Limit

Health Effects of Detected Contaminants:

Aluminum: Large aluminum intake may be connected with nerve damage. Particularly people with kidney damage are susceptible to aluminum toxicity and there is a risk of allergies. A correlation between aluminum uptake and an increased number of Alzheimer cases is suspected. Increased aluminum intake may also cause osteomalacia.

Barium: Barium is a naturally occurring ore used in a variety of manufactured goods. The EPA has found that in some people, short exposure to Barium in exceedance of the MCL can cause gastrointestinal disturbances and muscle weakness. Long term exposure to barium at levels above the MCL may cause high blood pressure.

Chloride: Chloride occurs naturally in water and is monitored as a secondary contaminant. Secondary contaminants are aesthetic (taste and odor) rather than health risks; however, in high concentrations sulfate can cause diarrhea in some people.

Chlorine: Some people who use water containing chlorine well in excess of the MRDL could experience irritating effects to their eyes and nose. Some people who drink water containing chlorine well in excess of the MRDL could experience stomach discomfort.

Chromium: Some people who use water containing chromium well in excess of the MCL over many years could experience allergic dermatitis.

Coliform Bacteria/E-Coli: Coliform Bacteria are common in the environment and are generally not harmful. The presence of these bacteria in drinking water is usually the result of a problem with the treatment system or the pipes that distribute the water and indicates that the water may be contaminated with germs that may cause disease.

Copper: Copper is an essential nutrient, but some people who drink water that contains copper in excess of the action level over a relatively short amount of time could experience gastrointestinal distress. Some people who drink water that contains copper in excess of the action level over many years could suffer liver or kidney damage. People with Wilsons Disease should consult their personal doctor.

Gross Alpha (48 Hour): Certain minerals are radioactive and may emit a form of radiation known as alpha radiation. Some people who drink water containing alpha emitters in excess of the MCL over many years may have an increased risk of getting cancer.

Haloacetic Acids: Some people who drink water containing haloacetic acids in excess of the MCL over many years may have an increased risk of getting cancer.

Hardness: Water hardness is the traditional measure of the capacity of water to react with soap and producing lather. Hard water often produces a noticeable deposit of precipitate (e.g. insoluble metals, soaps or salts) in containers, including "bathtub ring".

Lead: If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. South River Water is responsible for providing high quality drinking water but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 second to 2 minutes before using water for drinking and cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water hotline or at <http://www.epa.gov/safewater/lead>.

Manganese: The recommended upper limit for manganese is based on staining of laundry. Manganese is an essential nutrient, and toxicity is not expected from levels which would be encountered in drinking water.

Nickel: Some people who drink water containing nickel in excess of the MCL over many years may experience liver effects.

PFOA (Perfluorooctanoic Acid): Some people who drink water containing perfluorooctanoic acid in excess of the MCL over many years could experience problems with their blood serum cholesterol levels, liver, kidney, immune system, or, in males, reproductive system. Drinking water containing perfluorooctanoic acid in excess of the MCL over many years may also increase the risk of testicular and kidney cancer. For females, drinking water containing perfluorooctanoic acid in excess of the MCL over many years may cause developmental delays in a fetus and/or an infant.

PFOS (Perfluorooctanesulfonic Acid): Some people who drink water containing perfluorooctanesulfonic acid in excess of the MCL over many years could experience problems with their immune system, kidney, liver, or endocrine system. For females, drinking water containing perfluorooctanesulfonic acid in excess of the MCL over many years may cause developmental effects and problems with the immune system, liver, or endocrine system in a fetus and/or an infant. Some of these developmental effects can persist through childhood.

Secondary Contaminant: These parameters do not have an impact on health. Secondary Contaminants affect aesthetic qualities such as odor, taste or appearance. Secondary standards are recommendations, not mandates.

Sodium: Naturally occurring mineral. Sodium is essential for good health. Certain medical conditions, however, require sodium intake monitoring. Excessive sodium can adversely affect high blood pressure, heart disease or diabetes. Contact your physician for further information.

Sulfate: Sulfate occurs naturally in water and is monitored as a secondary contaminant. Secondary contaminants are aesthetic (taste and odor) rather than health risks; however, in high concentrations sulfate can cause Diarrhea in some people.

THMs (Trihalomethanes): Some people who drink water containing trihalomethanes in excess of the MCL over many years may experience problems with their liver, kidneys, or central nervous systems, and may have an increased risk of getting cancer.

Total Dissolved Solids: (TDS) in drinking water is not a health hazard. The recommended upper limit has been established based on the aesthetic properties of water. Water high in TDS may taste salty or brackish. High TDS may also indicate that other ions naturally present in water may be above established regulatory levels.

Zinc: Although humans can handle large amounts of zinc, too much can cause problems such as stomach cramps, skin irritations, vomiting, nausea, and anemia. Very high levels of zinc can damage the pancreas, upset protein metabolism and can also cause arteriosclerosis.

Violations

Our water system received two (2) violations in 2022. The first was for late submittal to the New Jersey Department of Environmental Protection (NJDEP) the mandatory State Lead Service Line form. We will make every effort going forward for more timely submission of our compliance requirements. The second violation was for a copper exceedance above the Action Limit of 1.3 ppm for Compliance Period January 1, 2022, to June 30, 2022. South River is working with the NJDEP on a resolution.

Source Water Assessment

The New Jersey Department of Environmental Protection (NJDEP) has completed and issued the Source Water Protection Report and Summary for this public water system, which is available at www.nj.gov/dep/watersupply/swap/creport.htm or by contacting the NJDEP, Bureau of Safe Drinking Water at 609-292-5550.

The table below illustrates the susceptibility rating for each individual source for each of the contaminant categories at this water system. For susceptibility ratings of purchased water, refer to the specific water system's source water assessment report. NJDEP considered all surface water highly susceptible to pathogens. For the purpose of the Source Water Assessment Program, radionuclides are more of a concern for ground water than surface water. If the system is rated highly susceptible for a contaminant category, it does not mean that a customer is or will be consuming contaminated drinking water. The rating reflects the potential for contamination of source water, not the existence of contamination. Public water systems are required to monitor for regulated contaminants and to install treatment if any contaminants are detected at frequencies and concentrations above allowable levels. As a result of the assessments, NJDEP may customize (change existing) monitoring schedules based on the susceptibility ratings. If you have questions regarding the source water assessment report or summary, please contact the Bureau of Safe Drinking Water at 609-252-5550.

Sources	Pathogens			Nutrients			Pesticides			Volatile Organic Compounds			Inorganics			Radio-nuclides			Radon			Disinfection Byproduct Precursors			
	H	M	L	H	M	L	H	M	L	H	M	L	H	M	L	H	M	L	H	M	L	H	M	L	
Wells - 4		2	2	4				3	1	4			4			4				4			4		

Susceptibility ratings for a public water system are based on the potential for a contaminant to be:

- At or above 50% of the Drinking Water Standard (MCL) = **(H) High**
- Between 10 and 50% of the Drinking Water Standard (MCL) = **(M) Medium**
- Less than 10% of the Drinking Water Standard (MCL) = **(L) Low**

Definitions:

Pathogens: Disease-causing organisms such as bacteria and viruses. Common sources are animal and human fecal wastes.

Nutrients: Compounds, minerals and elements that aid growth, and are both naturally occurring and man-made. Examples include nitrogen and phosphorus.

Volatile Organic Compounds (VOCs): Man-made chemicals used as solvents, degreasers, and gasoline components. Examples include benzene, methyl tertiary butyl ether (MTBE), and vinyl chloride.

Pesticides: Man-made chemicals used to control pests, weeds and fungus. Common sources include land application and manufacturing centers of pesticides. Examples include herbicides such as atrazine, and insecticides such as chlordane.

Inorganics: Mineral-based compounds that are both naturally occurring and man-made. Examples include arsenic, asbestos, copper, lead, and nitrate.

Radionuclides: Radioactive substances that are both naturally occurring and man-made. Examples include radium and uranium.

Radon: Colorless, odorless, cancer-causing gas that occurs naturally in the environment. For more information go to <http://www.nj.gov/dep/rpp/radon/index.htm> or call 800-648-0394.

(DBPs) Disinfectant Byproduct Precursors: A common source is naturally occurring organic matter in surface water. Disinfection byproducts are formed when other disinfectants (usually chlorine) used to kill pathogens react with dissolved organic material (for example leaves) present in surface water.

This Water Quality Report was prepared for South River Water Department by:
